Query Classification in Logfile-Analysis: Evaluation Issues and User Satisfaction

1

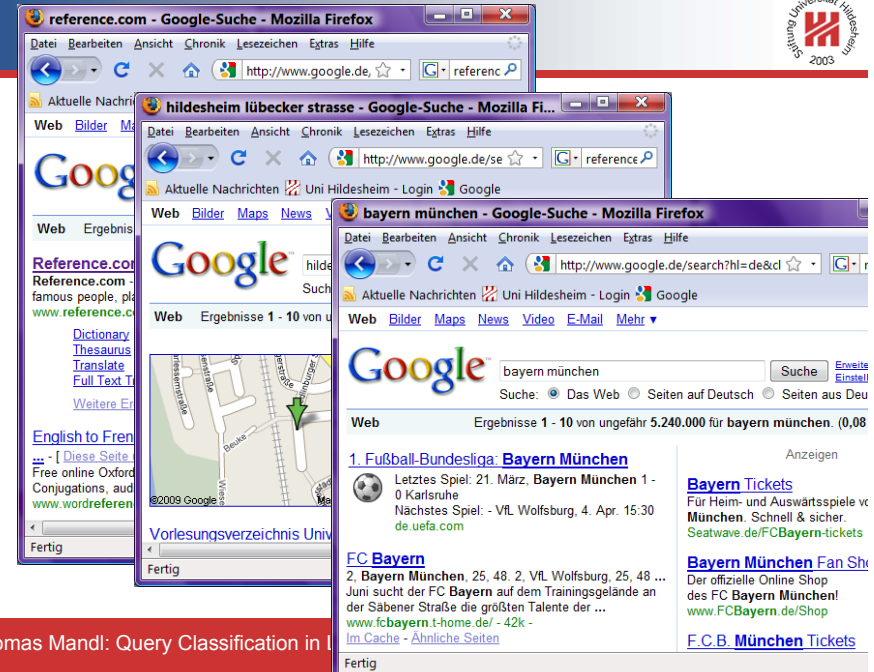

Thomas Mandl

2

Query Classification

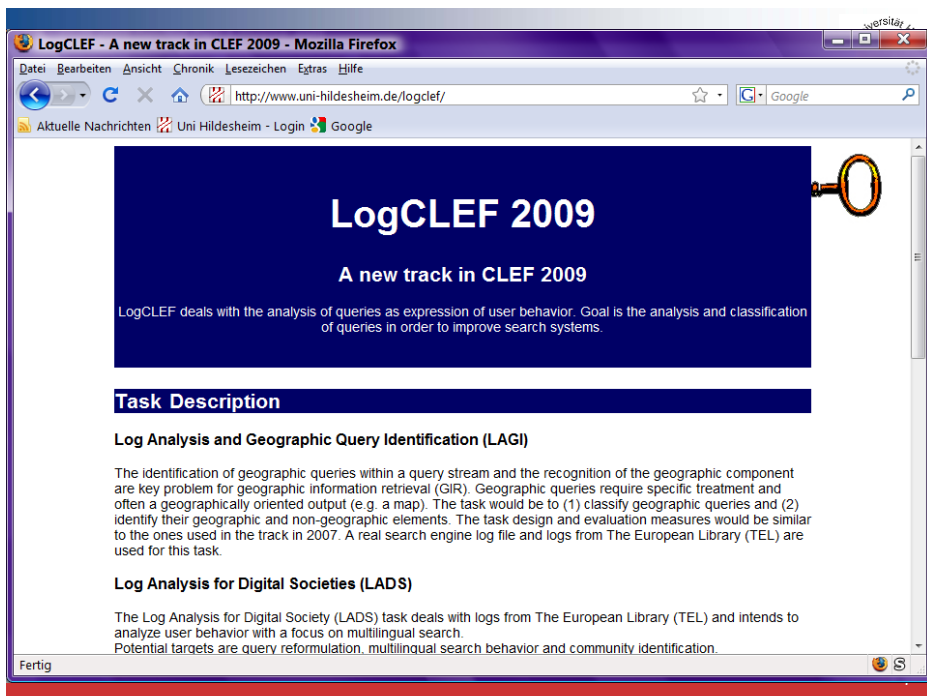

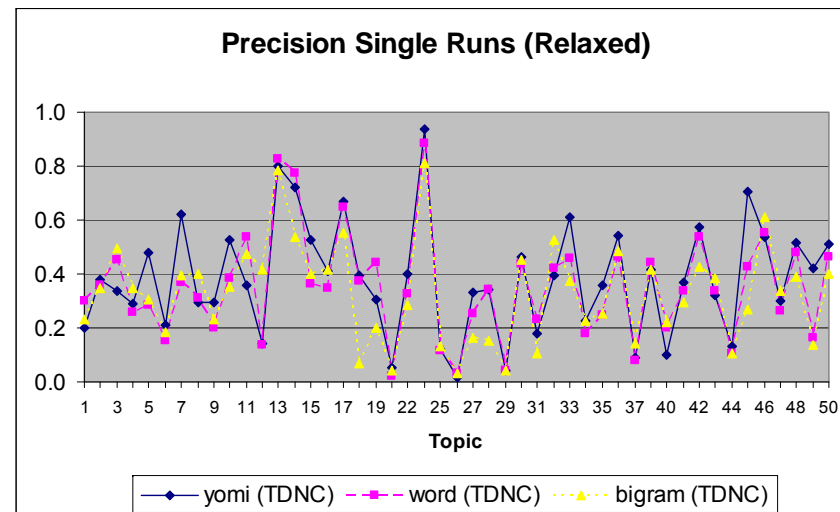

- To adapt the user interface (result display)
 - User behavior for navigational and informational queries differs
 - eye tracking study
 - URL or Snippet fixed for a longer time
 - (Cutrell & Guan 2007)
 - Geographical queries often require a map (Google)

3

- Retrieval performance

- „More work needs to be done on customizing methods for each topic“ (*Harman 2005*)
- Geographic Queries may require geographic reasoning (GeoCLEF)
- Difficult queries are solved well by several systems (*Hauff et al. 2009, Lease et al. 2009*)
- Analysis of errors (*RIA Workshop, Savoy 2007*)

- Geographic Query Classification and Parsing
 - Similar to GeoCLEF 2007 subtask
 - Find geo queries in a search engine log
 - Extract geo component
 - Analyzing options for log data
 - Support from MITRE Corp.
- Log Analysis in Digital Societies (LADS)
 - TEL query and activity logs
 - Analysis of user behavior
 - Permission for log release likely

- Query log from the MSN search engine
 - in English
 - 800.000 queries (collected August 2006)
 - 500 queries were labelled and used for evaluation
 - 100 queries for training
 - 400 for testing

- Find queries with a geographic scope
 - Extract geo component

Example:

- Find queries with a geographic scope
 - Extract where component
 - Extract geo-relation-type
 - Extract what component
 - Classify what type {information, yellow page, map}

Example:

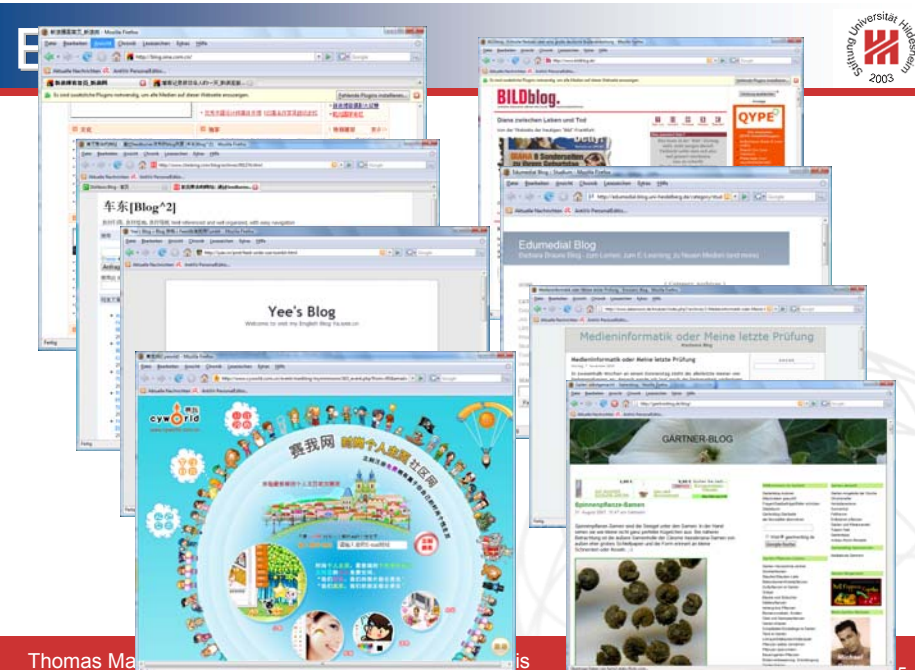

- LogFile from TUMBA: 350.652 lines of tumba! logs, anonymized and manually reviewed

```
[Jan/2004] GET /pesquisa?terms=roswell+fanfiction HTTP/1.1

[Oct/2003] GET /pesquisa?site=ZZZ&terms=mexico HTTP/1.1 "ZZZ/85.htm" 1
```

- Germans use more external links

- More Chinese reactions after more than one week

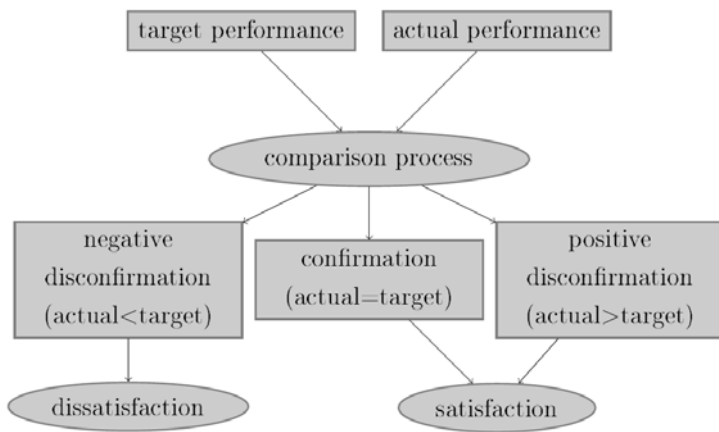

- What about logs from social media?
- International / cultural aspects?

- Selection of Queries from a Google Log
- Some test persons reconstructed the context and intended information need
- Other test persons performed searches
 - Judged relevance of top results
 - Reported their overall satisfaction
- A measure was found that correlated between satisfaction and relevance of top three hits
 - (*Huffmann & Hochster 2007*)

- Two tasks
 - In 5 minutes, as many relevant documents as possible should be found
 - Analysis
 - Precision-oriented: time to find one single document
 - Number of documents found
 - Differently performing systems are created artificially
 - 5 different MAP levels between 0.55 and 0.95
 - Results lists with 100 documents
- *Turpin & Scholer 2006*

- Between groups
 - Two groups of users
 - Each test user sees only one system
 - Hard to achieve different satisfaction ratings
- Within groups
 - All users are presented all systems (usually both test conditions)
 - Order of presentation is balanced
 - Users can compare (nice for design studies)
 - Not realistic for IR (search twice?)

(Homburg et al. 1999: 85)

- Sample
 - 89 female subjects between ages 17 and 32 years
- Three CLEF-Topics
 - (10 min. per task)
 - Renewable energies
 - Castor transports in Germany
 - Child labour in Asia

Lamm & Mandl et al. 2009

Two factor design

		System performance	
		low	high
Expectations	high	20 subjects	20 subjects
	low	20 subjects	20 subjects

Lamm & Mandl et al. 2009

Analysis

- User satisfaction
 - Questionnaire using a 7-point scale
- User performance
 - Effectiveness measures
 - Completeness (recall)
 - Accuracy (precision)
- Analysis of variance
 - Investigation of group differences

Lamm & Mandl et al. 2009

Effectiveness measures

- User precision

$$\frac{\text{Documents correctly identified as relevant}}{\text{Total number of relevant documents in list}}$$
- User recall

$$\frac{\text{Documents correctly identified as relevant}}{\text{Documents judged as relevant}}$$

Correctly means:
Like the CLEF
assessors

Results I

- Expectations
 - Expected influence, but not significant
 - Manipulation likely not sufficient
- System performance
 - Significant influence
 - User satisfaction
 - Precision oriented questions
 - User performance
 - Compensation for recall measures
 - Significant differences for precision measures

Results II

User satisfaction: indirect questions

- (1) „The filtering of articles could have been better.“
- (2) „Most articles have been relevant with respect of the queries.“

Results III

User satisfaction C/D paradigm

Results IV

User performance: Assimilation effect

Percentage differences:

- User precision: 8%
- disagreement on relevant docs: 57%
- disagreement on relevant docs irrelevant: 18%

Results:

- Requested satisfaction correlates significantly with system level
- Expectation plays an estimated role, but not significantly
- Precision-oriented measures higher for better system
- Recall-oriented measures equal
- -> User compensate
 - More documents are observed
 - Criteria for relevance are relaxed

Compensation

- Relevance judgments are context dependent
 - Especially the number of relevant documents already encountered is important
 - Individual threshold might be lowered

(Scholer & Turpin 2008)

- Consistent with experience from relevance judgment for batch experiments

Scientific Challenge

- User Satisfaction and Log Analysis
 - How can we determine satisfaction from logs?
 - Logs as a basis for user experiments?

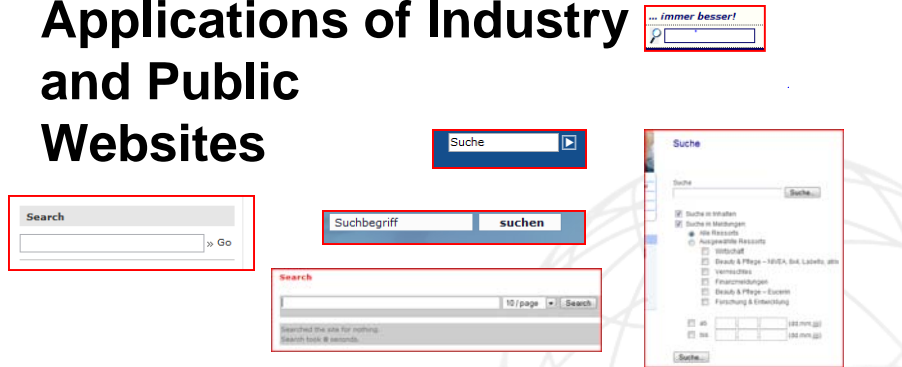

Practical Applications

- Do enterprises control search quality (by log analysis)?

Results from a survey among 192 decision makers from Swiss Enterprises

Evaluating the Search Applications of Industry and Public Websites

Martin Braschler, Ben Heuwing, Peter Schäuble,
Jürg Stuker, Christa Womser-Hacker, Janko Zehe, Susanne Franke

Overview

- Consortium
- Goal: To Check Current State of Site Search
- Approach
 - Indicators
 - 35 websites were tested
- Results
 - Main Indicators
 - Google-Baseline
 - Interpretation

Example

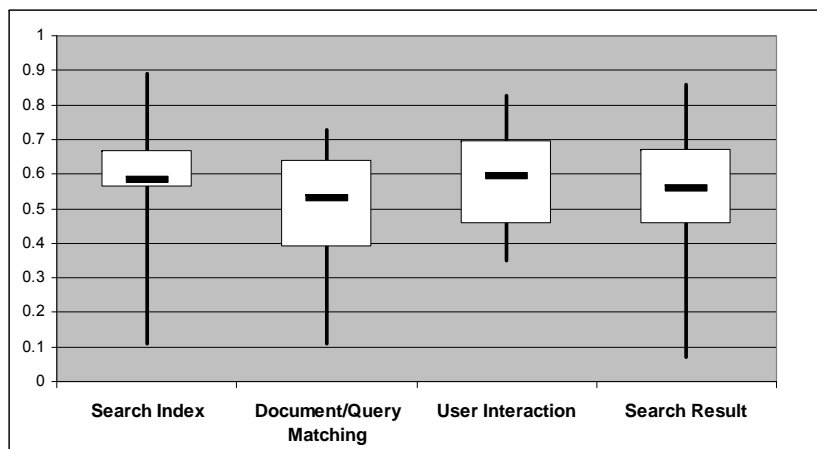

Search Index

- Completeness
 - All pages indexed?
- Freshness
 - New pages indexed?
 - Modified pages updated?
- Query / Document Analysis
 - Tokenization
 - Normalization
 - E.g. Jürg = JÜRG

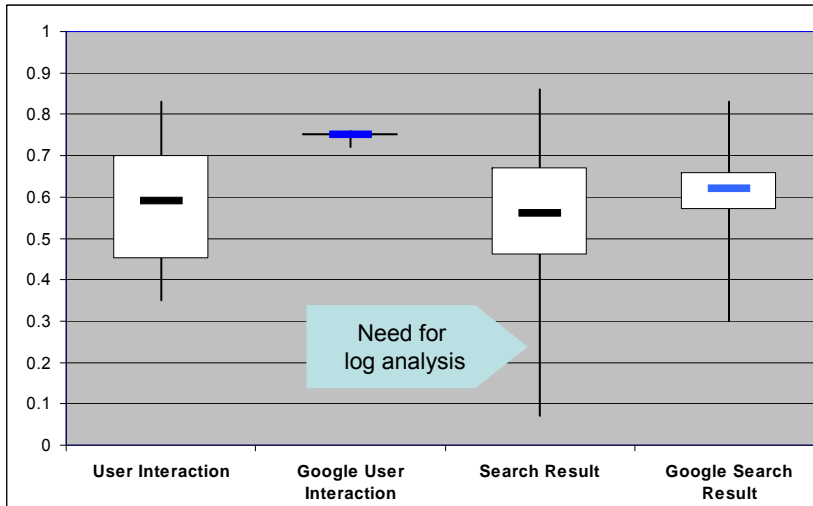

- Presentation of hit list
 - Snippet and other elements of a hit
 - Visual Coding
- User guidance
 - Interaction and functions
 - E.g. Enter starts search? Similar doc search?
 - Error handling, sub collections, zero hits, typos ...
- Performance

- Navigation Tasks
 - E.g. Can the *Jobs* page be found quickly?
- Information Tasks
 - Depend on company
- Fact Queries (QA style)
 - E.g. Can the number of employees be found?

- How well does Google with site search?
 - `www.google.de -> site:www.xyz.de`
- Approach
 - For half of the sites
 - search tasks were also done with Google
 - and evaluated

Google Baseline - Comparison

Workshop "Information Retrieval 2009" der Fachgruppe Information Retrieval

Angesichts der ständig anwachsenden Flut von Daten und insbesondere von Text stellt das Information Retrieval eine Schlüsseltechnologie in der modernen Wissensgesellschaft dar. Die Analyse und Verarbeitung von nicht strukturierten Daten ist eine der wichtigsten Herausforderungen für das professionelle Wissensmanagement. Die Bedeutung von Internet-Suchmaschinen und professionellen Suchsystemen wächst für Benutzer und Informationsanbieter. Die Allgegenwärtigkeit von Suchsystemen führt zum Einsatz von Information Retrieval Technologien in zahlreichen (z.B. mobilen und internationalen) Nutzungssituationen und für spezifische Objekte (z.B. Produkte, Patente, Videos, Musik, Blogs). Innovative Produktentwicklungen stellen die Grundfragen des Information Retrieval immer wieder neu. Die Qualität von Information Retrieval Systemen muss für jeden Kontext angemessen evaluiert werden. Dieser Herausforderung stellen sich die großen Evaluierungsinitiativen mit ihren umfangreichen und heterogenen Benchmarks.

Der Workshop Information Retrieval 2009 bietet ein Forum für die wissenschaftliche Diskussion und den Austausch von Ideen. Im Rahmen der Workshop-Woche "Lernen, Wissen und Adaptivität" (LWA) an der Technischen Universität Darmstadt findet der Workshop der Fachgruppe Information Retrieval (<http://www.fg-ir.de>) der Gesellschaft für Informatik (GI) statt. Die Einbettung in den fachlichen Kontext der LWA zeigt die Verknüpfungen zu anderen Fachgebieten wie dem Wissensmanagement und dem Maschinellen Lernen auf. Die Veranstaltung setzt die erfolgreiche Reihe von Workshops der Fachgruppe fort. Die LWA spricht Wissenschaftler und Entwickler aus den Hochschulen und der Industrie an. Insbesondere werden auch Diplomanden und Doktoranden zur Teilnahme ermütigt.
